

Theoretical Models for Computing: Introduction

Presenter: Dr. Ha Viet Uyen Synh.

How to solve a problem in computer science?

How to solve a problem in computer science?

The number of states is small, we can check all of them fast.

Level 1
“Exhausted check”
method

How to solve a problem in computer science?

The number of states is large, we spend a lot of time to check all of them.

Level 2
Graphs

How to solve a problem in computer science?

The number of states is huge, we can't check all of them. But there is a mathematical model for its domain.

Level 3

Convex Optimization

MCMs: Monte Carlo Model

MRFs: Markov Random Field

Multiscale technique

Discrete Prob. Vs Relational Prob.

How to solve a problem in computer science?

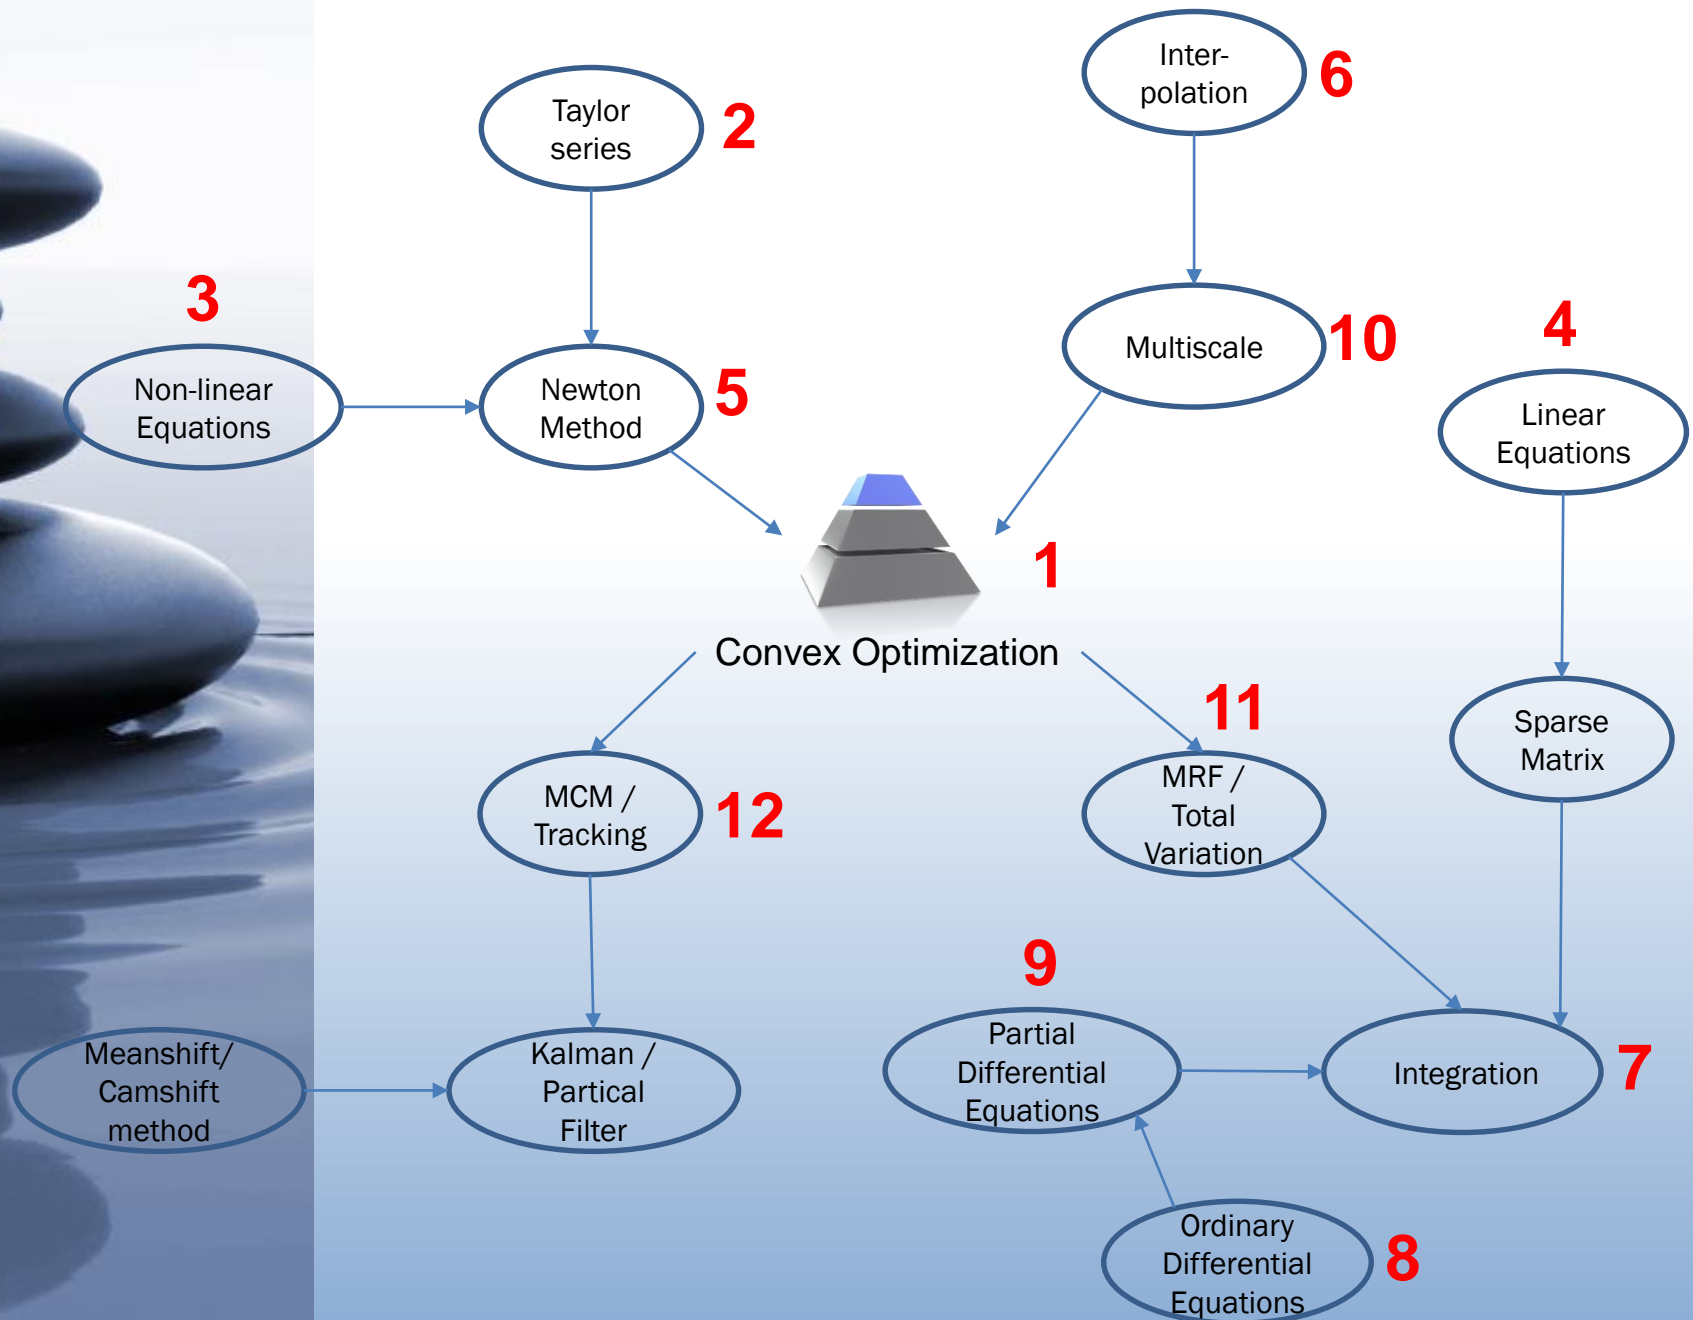

Level 4

Non-convex Optimization

The **number of states is huge**,
we can't check all of them.
And there is **NO mathematical
model** for its domain.

There are some dilemmas in the problem

Course Material

Environment: Visual C++ 2k12

Library: OpenCV 3.0

Blackboard

Textbook #1

Numerical Methods for Engineers 6th Edition

Textbook #2

Applied Numerical Methods with MATLAB for
Engineers and Scientists

Textbook #3

Advanced Engineering Mathematics

Textbook #4

Numerical Recipes: The Art of Scientific Computing

Grading

Quiz: 10%

Lab. Assignments: 20%

Midterm Test: 30% (open-book test)

Final Exam: 40% (open-book test)

Any Questions?
